

Dry-run fit: sheets on their cell, faulty vs corrected

faulty pass
437 warped

161 on cell

276 over 150 m off

corrected pass
436 warped

434 on cell

2

Median miss among on-cell sheets: 11 m $\rightarrow$ 10 m; worst on-cell 50 m $\rightarrow$ 95 m as 273 sheets join that population.

The correction moves displaced sheets onto their cells rather than improving sheets already on them.
